TECHNICAL SKILLS

Languages: Python, TypeScript, HTML/CSS, SQL, R

Frontend: React, Next.js, TailwindCSS

Backend: Node.js, Express.js, FastAPI, REST APIs

Infrastructure & Data: PostgreSQL, Supabase, MongoDB, Docker, AWS, DigitalOcean, GitHub Actions

AI & Tooling: OpenAI API, Prompt Engineering, Postman, Git

PROFESSIONAL EXPERIENCE

Citrus

Toronto, ON

Founder & Full-Stack Engineer

Sept 2024 – Present

- Founded an AI-powered interview prep platform after running structured customer discovery with engineers at every level. Turned recurring friction points in existing prep workflows into concrete product priorities.
- Architected the full stack using **React, TypeScript, FastAPI, PostgreSQL, and Supabase**. Designed auth, session management, assessment delivery, and real-time result pipelines from scratch, keeping the system modular enough to iterate quickly without touching core infrastructure.
- Built a code execution backend with sandboxed runtime isolation, dynamic test case evaluation, and structured AI-generated scoring feedback, enabling automated technical assessment at scale.
- Launched a waitlist-driven onboarding pipeline that grew to **70+ pre-launch signups**, establishing direct user feedback loops that fed directly into product and engineering decisions.

Tailed

Montreal, QC

Full-Stack Engineer

Sept 2024 – Nov 2025

- Rebuilt the company landing page in **React** and **TailwindCSS**, improving load performance and tightening the user funnel to better convert inbound traffic into qualified leads.
- Designed and shipped a calendar integration system that let HR teams schedule and coordinate technical interviews directly inside the platform, surfacing availability conflicts in real time and eliminating most of the manual back-and-forth with candidates.
- Reworked recruiter-facing workflows across the **React** frontend and **Node.js/Express** backend. Richer candidate profiles, faster navigation, and improved state handling cut the time recruiters spent per candidate evaluation.
- Debugged production issues directly with founders and users, consistently shipping fixes and requested features within tight turnaround windows without compromising maintainability.

OpenText

Waterloo, ON

Software QA Automation Developer

May 2023 – Aug 2023

- Wrote **150+ Selenium-based automated tests** spanning UI interactions, backend integration, and regression coverage for enterprise asset management software used by large-scale global clients.
- Wired automated test suites into **CI/CD pipelines** across **30+ internal projects**, cutting QA turnaround time and increasing deployment confidence for cross-functional engineering teams.
- Debugged full-stack issues across React frontends and backend services alongside developers, contributing targeted fixes and tooling improvements that reduced recurring regressions.
- Refactored internal QA tooling using modular OOP design patterns, making the test infrastructure significantly easier to extend as new product teams onboarded.

PROJECTS

- **AI Restaurant Scheduling Platform:** Built a full-stack scheduling system for restaurant operators using **React, FastAPI, PostgreSQL, and Supabase**. Integrated AI-assisted shift generation to automate schedule balancing, conflict detection, and employee availability matching across **10+ restaurant teams**, reducing the manual coordination overhead that managers deal with during high-volume operations.

EDUCATION

University of Waterloo

Waterloo, ON

B.A.Sc. Chemical Engineering

Sept 2019 – Aug 2024

- Pursued software engineering independently through hands-on product development and full-stack application design, building depth across the stack outside of formal coursework.
- Built a foundation in systems modeling, process optimization, and quantitative problem-solving, skills that directly influence my approach to distributed systems, API design, and architectural tradeoffs in software.
- **Relevant CS Coursework:** Data Structures & Algorithms, Numerical Methods, Computational Methods, Systems Design
